Appendix

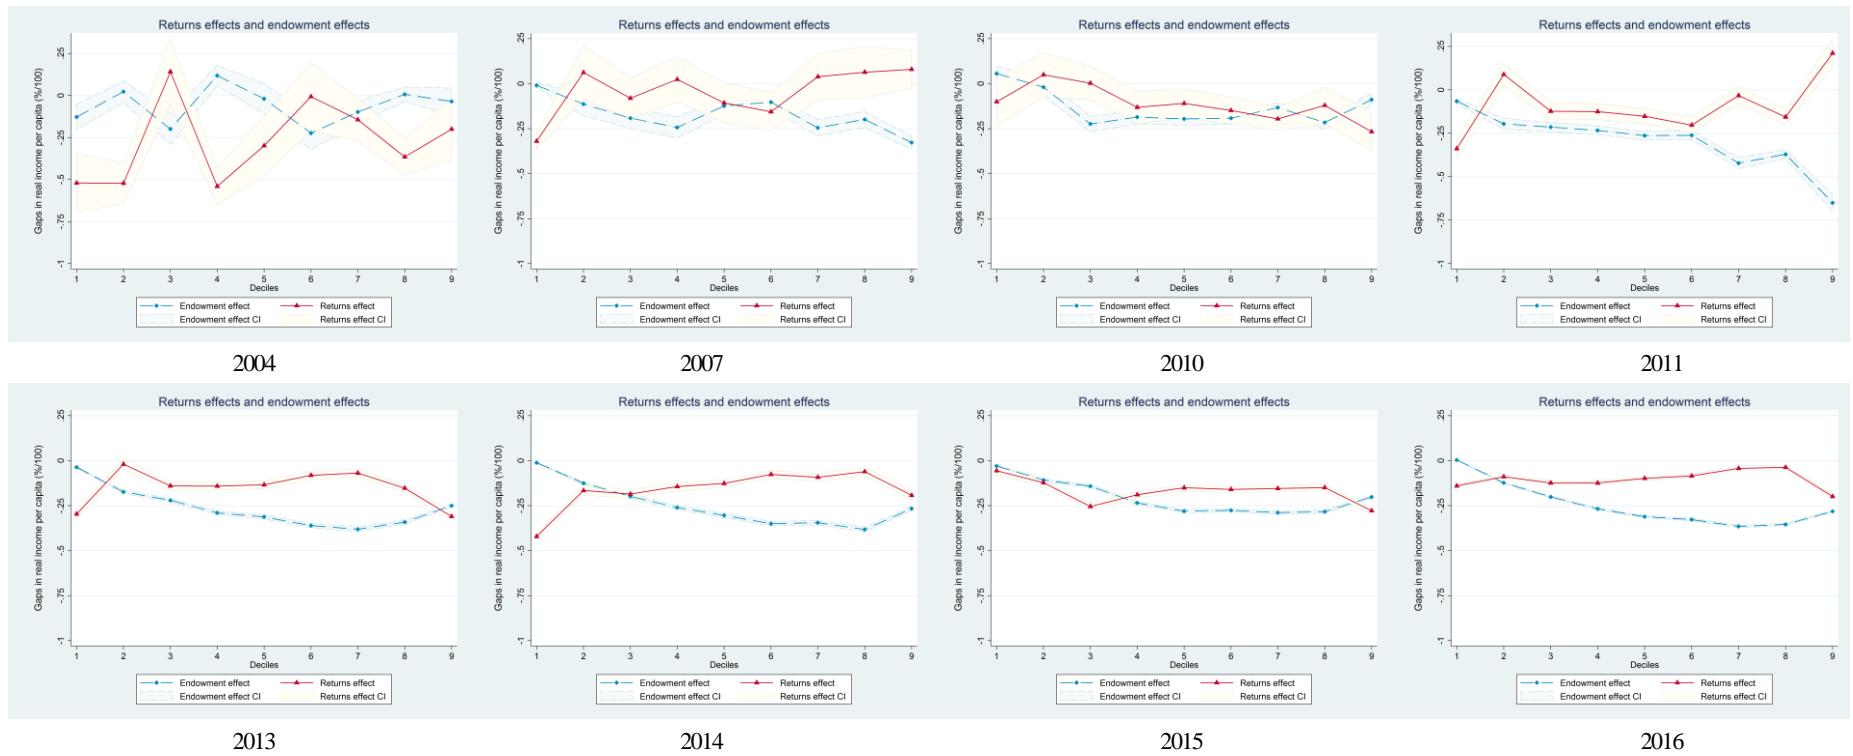

Fig. A.1. Endowment and returns effects: labor income, rural vs. urban residence. (% differences in income)

Notes: Author's analysis of LIS data. Urban status unavailable in 2000. The endowment and returns effects show the percentage income gaps ($\times 100$) due to, respectively, differentials in the endowments of all measurable characteristics, and differentials in the returns to all measurable characteristics and other unmeasured differentials. Regression specifications control for head demographics (sex, age, age², marital status), education (years attained, binary edu. levels), employment (binary empl. status, sector indicators, engagement in farming), household composition (size, % children, % elderly, hhd. composition type indicators), and residence (region indicators). Negative effects are pro-urban. The sum of the endowment and returns effects gives the estimated percentage income gap at each decile of the income distribution.

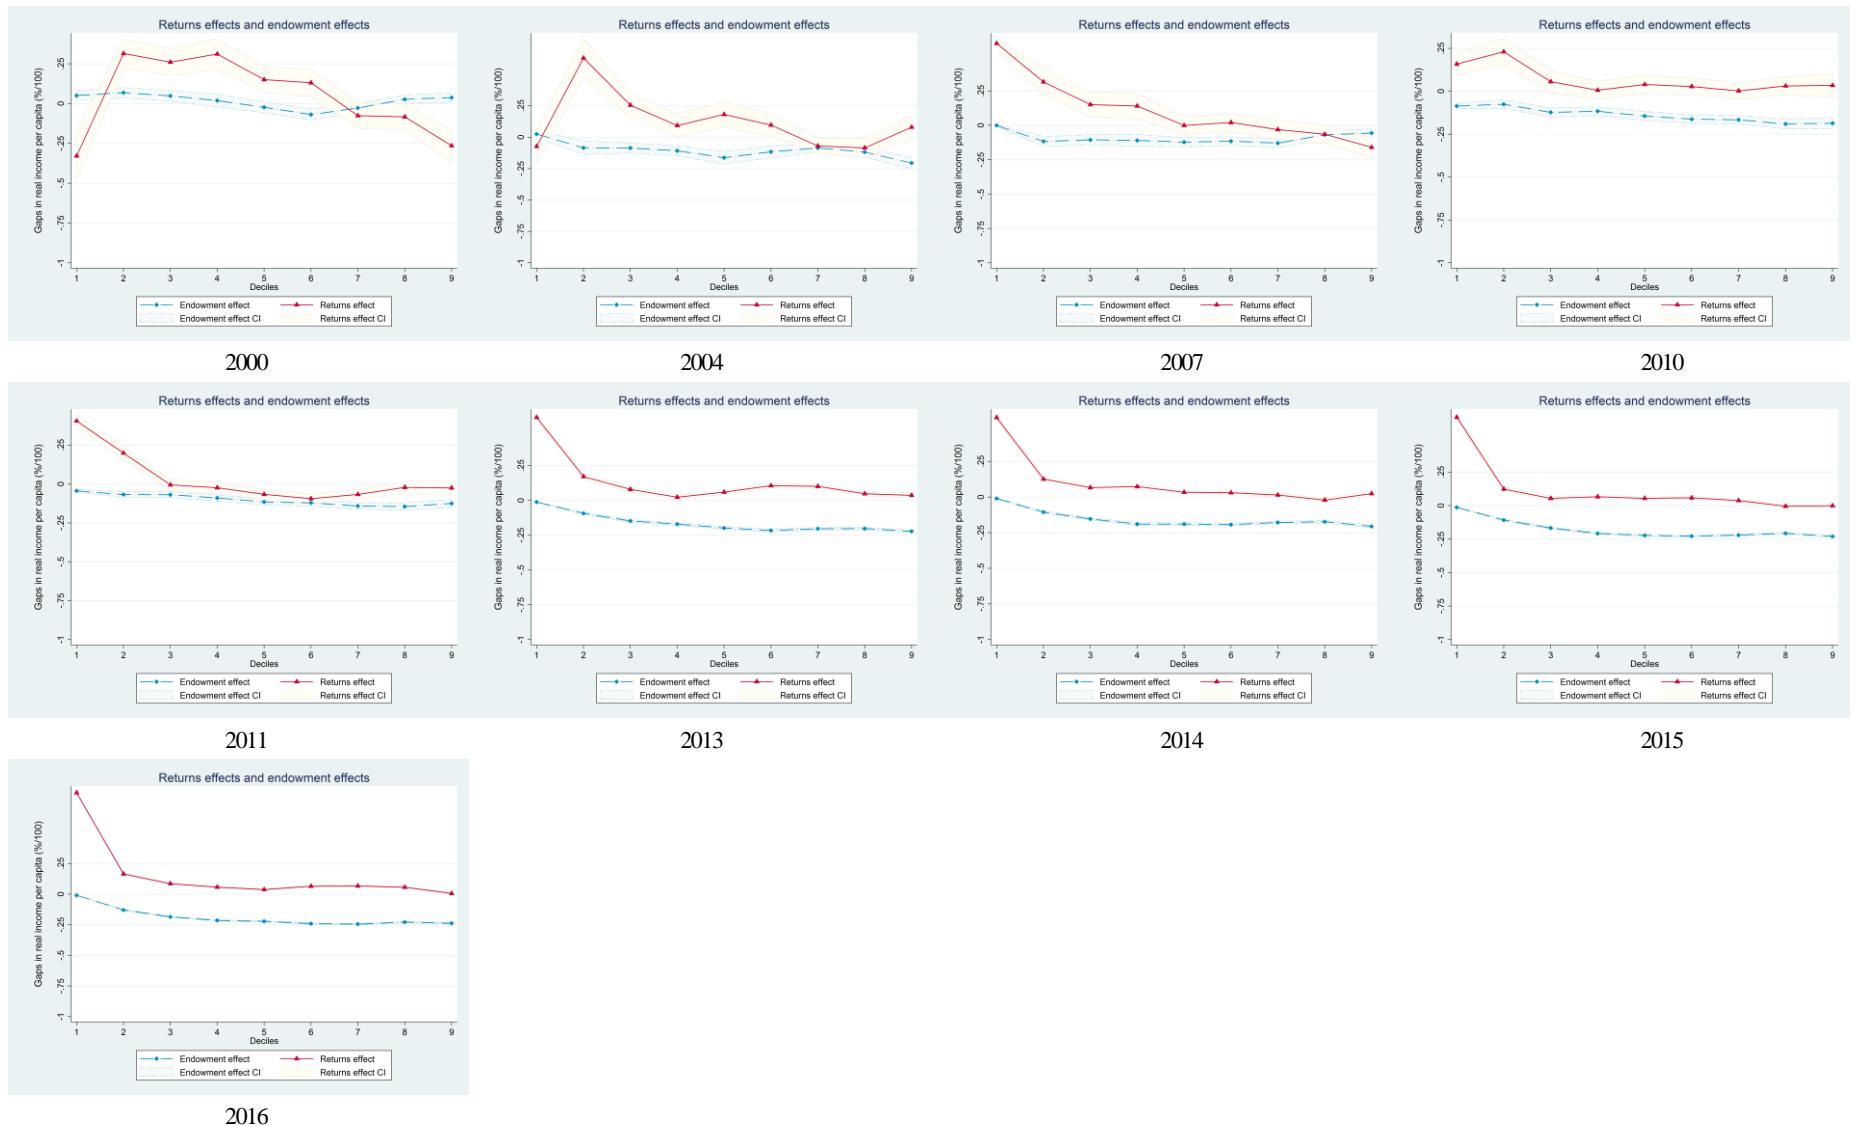

Fig. A.2. Endowment and returns effects: labor income, farming vs. non-farming hh. (% differences in income)

Notes: Author's analysis of LIS data. The endowment and returns effects show the percentage income gaps ($\times 100$) due to, respectively, differentials in the endowments of all measurable characteristics, and differentials in the returns to all measurable characteristics and other unmeasured differentials. Regression specifications control

for head demographics (sex, age, age², marital status), education (years attained, binary edu. levels), employment (binary empl. status, sector indicators), household composition (size, % children, % elderly, hhd. composition type indicators), and residence (urban/rural, region indicators). Negative effects are pro-nonfarming households. The sum of the endowment and returns effects gives the estimated percentage income gap at each decile of the income distribution.

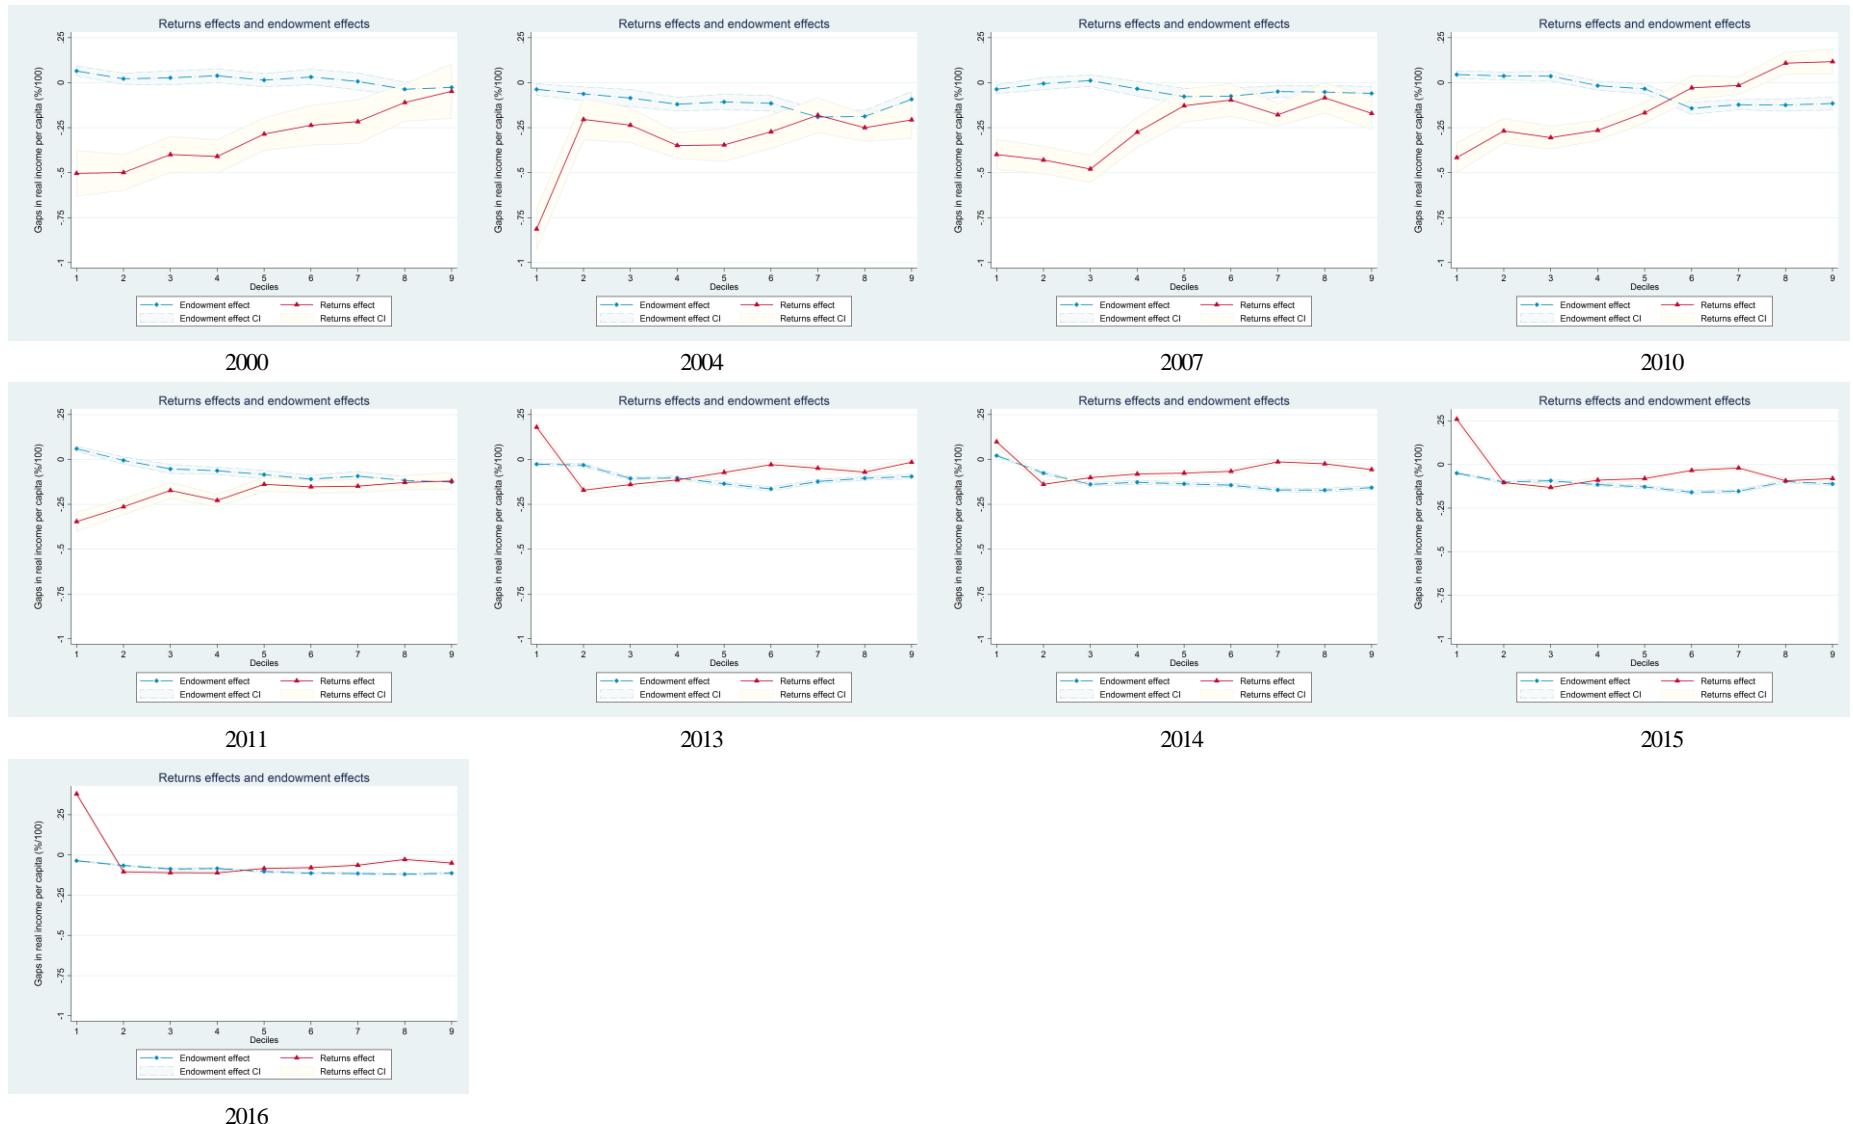

Fig. A.3. Endowment and returns effects: labor income, female vs. male headed hh. (% differences in income)

Notes: Author's analysis of LIS data. The endowment and returns effects show the percentage income gaps ($\times 100$) due to, respectively, differentials in the endowments of all measurable characteristics, and differentials in the returns to all measurable characteristics and other unmeasured differentials. Regression specifications control

for head demographics (age, age², marital status), education (years attained, binary edu. levels), employment (binary empl. status, sector indicators, engagement in farming), household composition (size, % children, % elderly, hh. comp. types), and residence (urban/rural, region indicators). Negative effects are pro-male headed households. The sum of the endowment and returns effects gives the estimated percentage income gap at each decile of the income distribution.

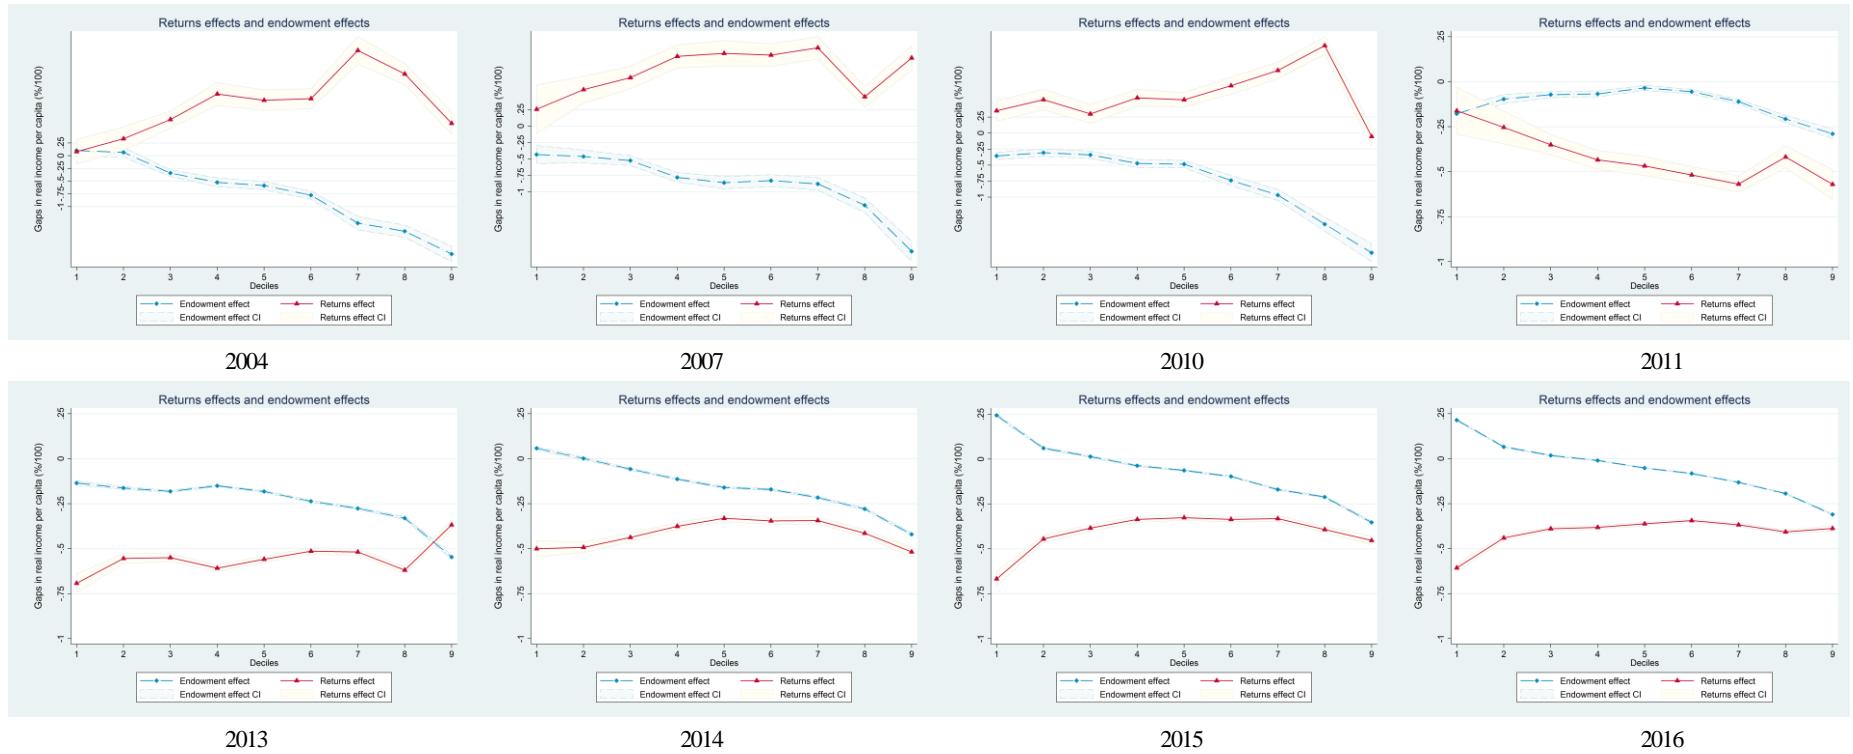

Fig. A.4. Endowment and returns effects: home production for own cons., rural vs. urban residence. (% differences in income)

Notes: Author's analysis of LIS data. Urban status unavailable in 2000. The endowment and returns effects show the percentage income gaps ($\times 100$) due to, respectively, differentials in the endowments of all measurable characteristics, and differentials in the returns to all measurable characteristics and other unmeasured differentials. Regression specifications control for head demographics (sex, age, age², marital status), education (years attained, binary edu. levels), employment (binary empl. status, sector indicators, engagement in farming), household composition (size, % children, % elderly, hhd. composition type indicators), and residence (region indicators). Negative effects are pro-urban. The sum of the endowment and returns effects gives the estimated percentage income gap at each decile of the income distribution.

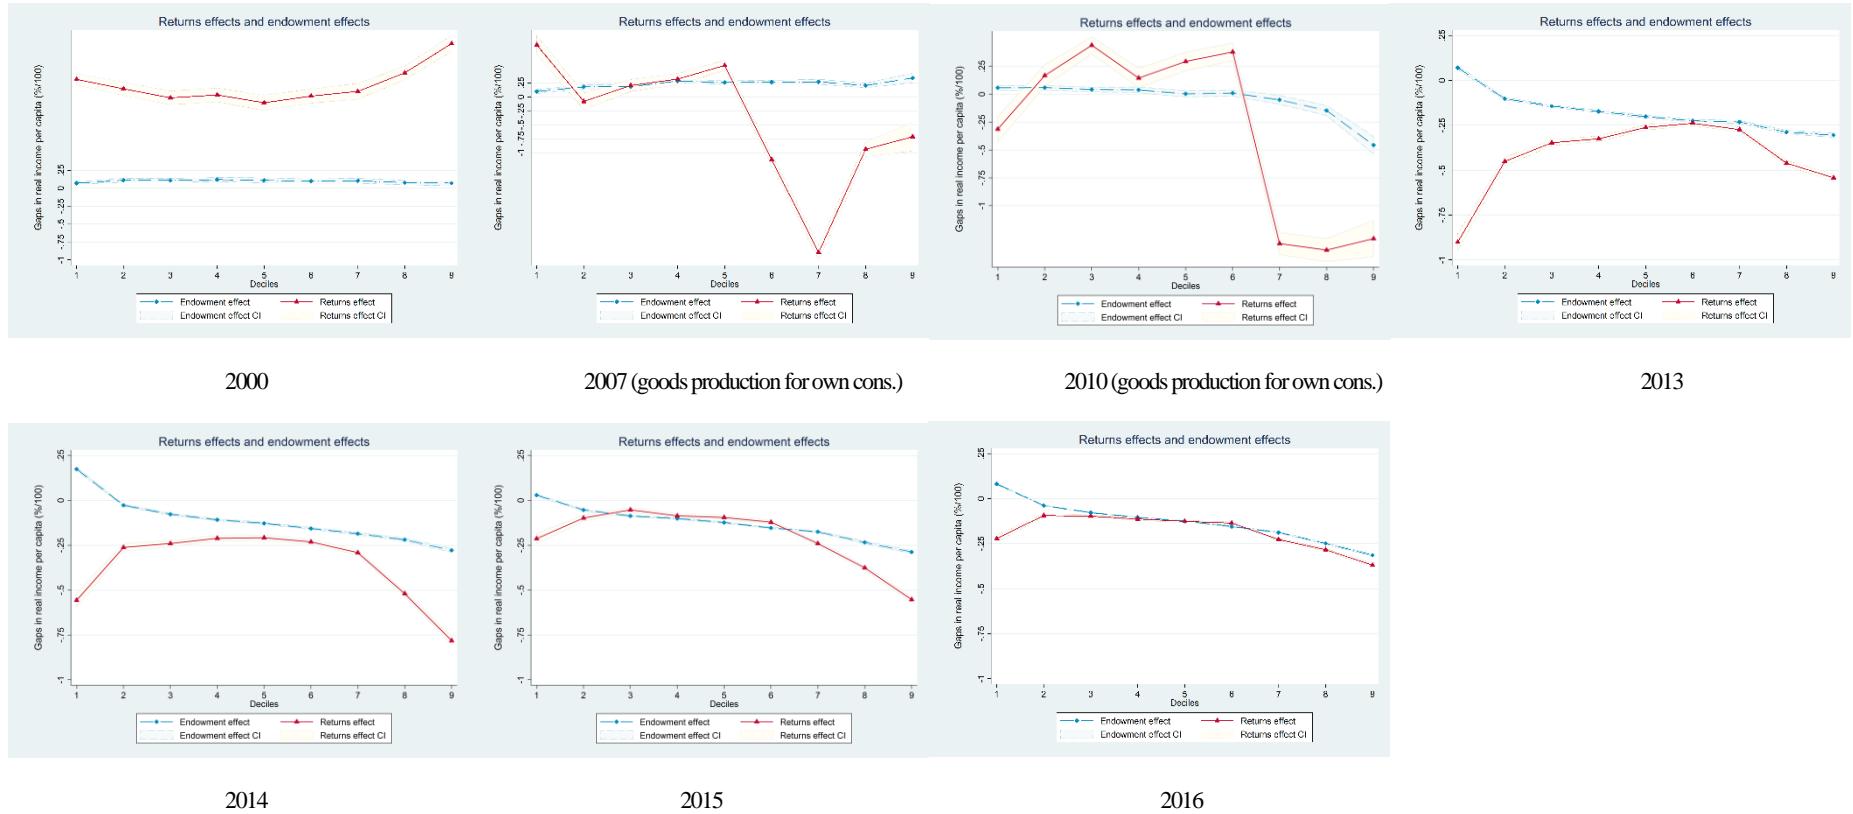

Fig. A.5. Endowment and returns effects: home production for own cons., farming vs. non-farming hh. (% differences in income)

Notes: Author's analysis of LIS data. Because of small sample sizes and joint distributions among variables, analysis was not performed in 2004 and 2011; In 2007 and 2010, analysis was performed only on home goods-production for own consumption, omitting owner-occupied imputed rent and use value of durables. The endowment and returns effects show the percentage income gaps ($\times 100$) due to, respectively, differentials in the endowments of all measurable characteristics, and differentials in the returns to all measurable characteristics and other unmeasured differentials. Regression specifications control for head demographics (sex, age, age², marital status), education (years attained, binary edu. levels), employment (binary empl. status, sector indicators), household composition (size, % children, % elderly, hhd. composition type indicators), and residence (urban/rural, region indicators). Negative effects are pro-nonfarming households. The sum of the endowment and returns effects gives the estimated percentage income gap at each decile of the income distribution.

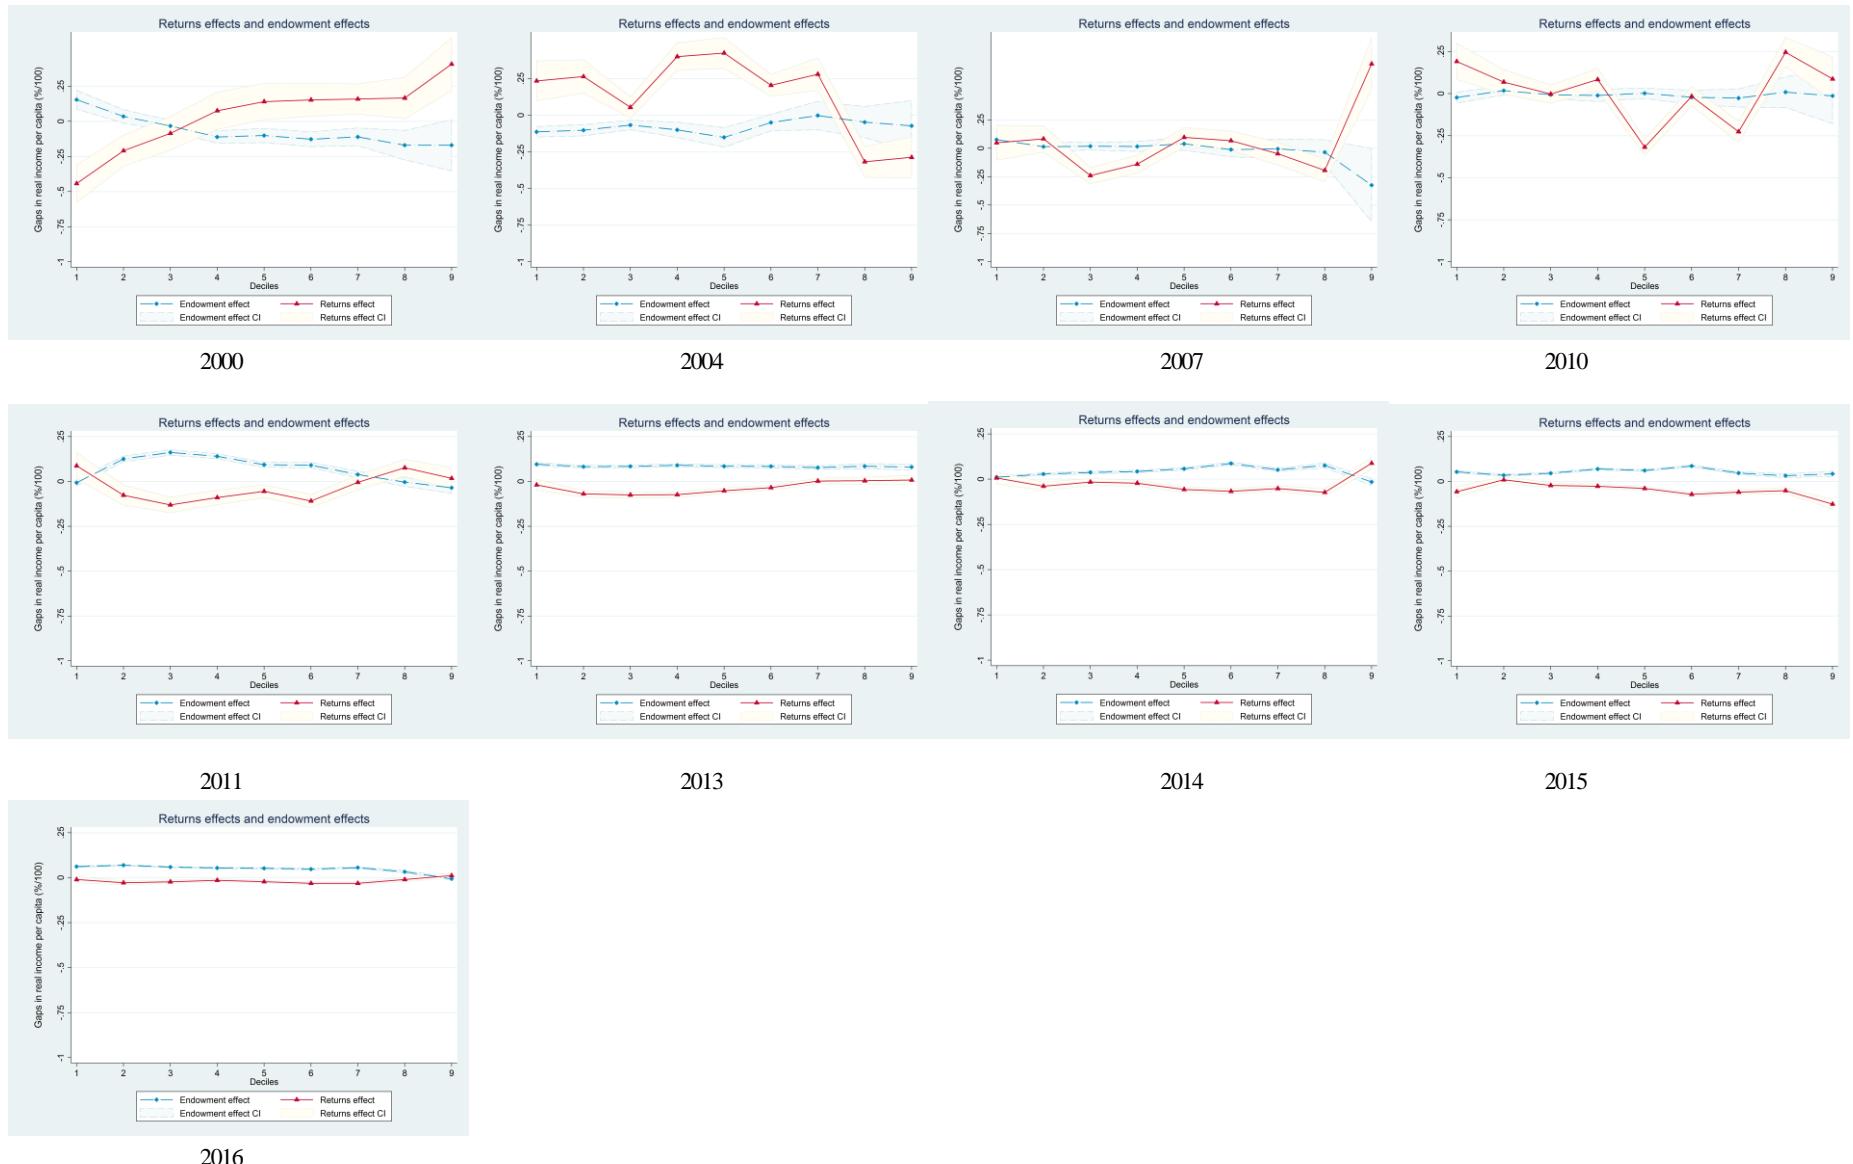

Fig. A.6. Endowment and returns effects: home production for own cons., female vs. male headed hh. (% differences in income)

Notes: Author's analysis of LIS data. The endowment and returns effects show the percentage income gaps ($\times 100$) due to, respectively, differentials in the endowments of all measurable characteristics, and differentials in the returns to all measurable characteristics and other unmeasured differentials. Regression specifications control for head demographics (age, age², marital status), education (years attained, binary edu. levels), employment (binary empl. status, sector indicators, engagement in farming), household composition (size, % children, % elderly, hhd. composition type indicators), and residence (urban/rural, region indicators). Negative effects are pro-male headed households. The sum of the endowment and returns effects gives the estimated percentage income gap at each decile of the income distribution.

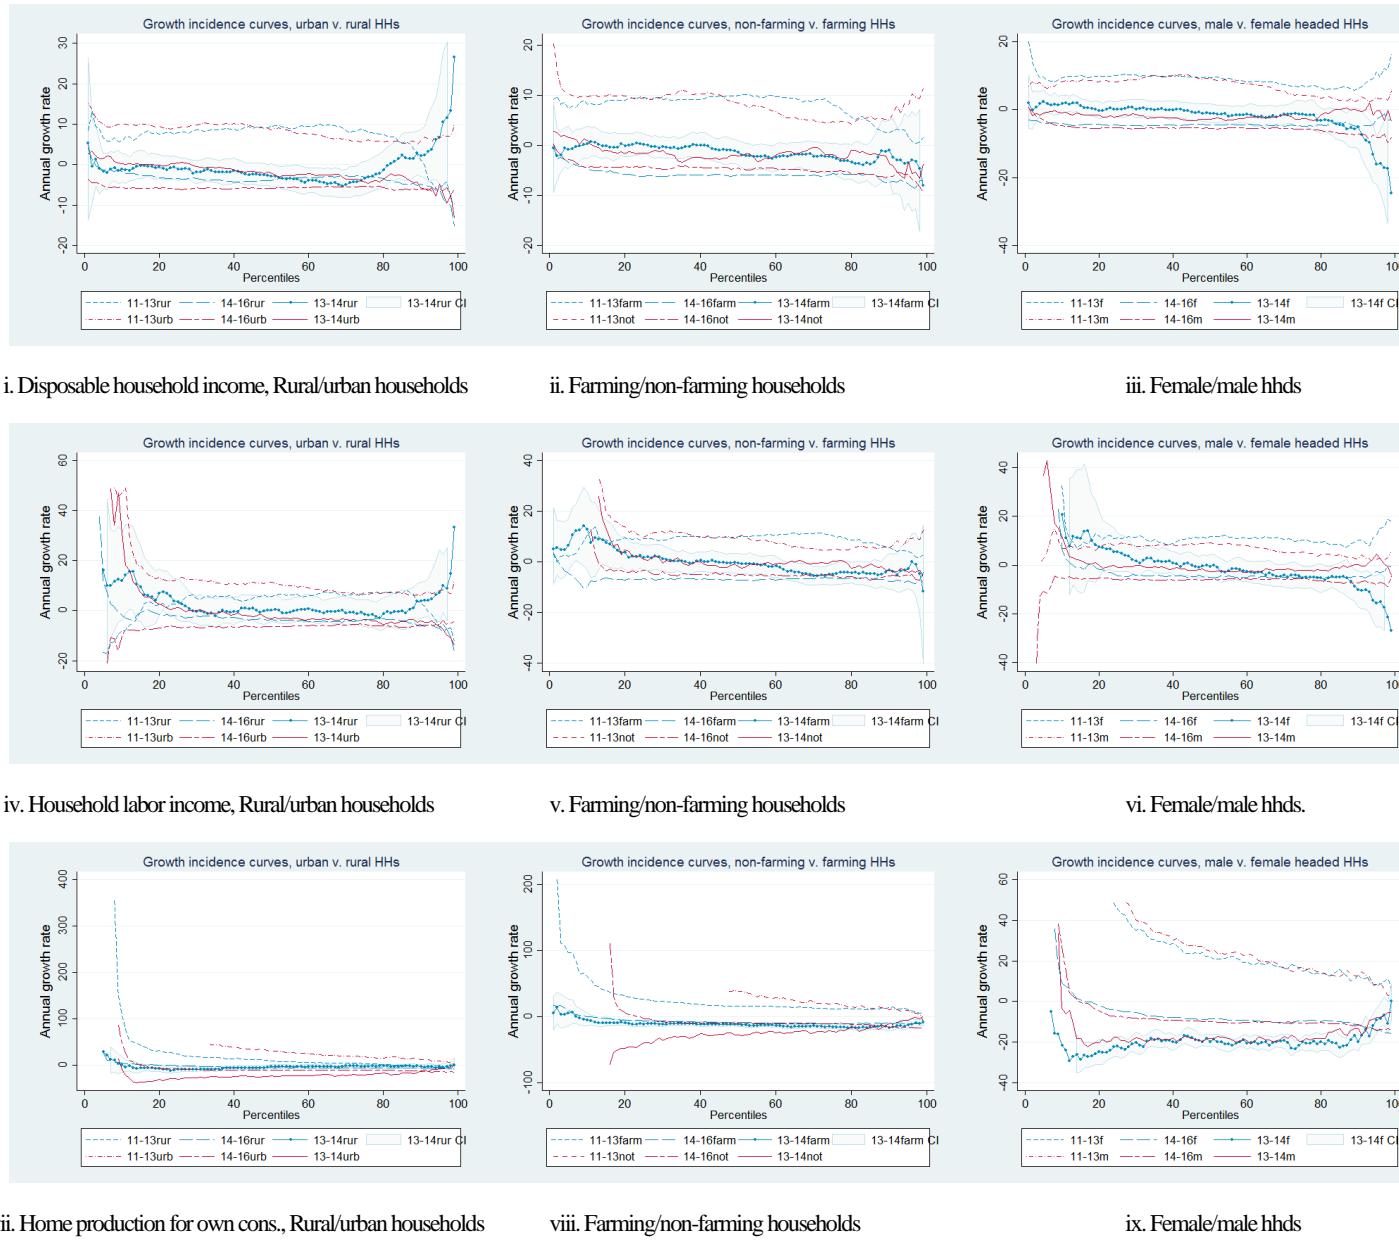

Fig. A.7. Quasi difference in difference analysis of growth incidence curves, different income concepts per adult equivalent.

Table A.1. Distribution of real income per adult equivalent. (2016 Russian rubles)

Labor – home prod

Notes: Samples weighted using analytical weights and count of household members. Gini, GE and Atkinson inequality indexes multiplied by 100 for clarity. Adult equivalence scale is square root of household members. Results may differ from statistics reported by LIS because an older version of data may have been used.
