\* **Correspondence:** E-mail: [lihl@sdnu.edu.cn](mailto:lihl@sdnu.edu.cn).

**Abstract:** From the connections between permutations and labeled simple graphs, we generalized the super-shuffle product and the cut-box coproduct on permutations to labeled simple graphs. We then proved that the vector space spanned by labeled simple graphs is a Hopf algebra with these two operations.

**Keywords:** Hopf algebra; labeled simple graph; super-shuffle product; cut-box coproduct

### 1. Introduction

In 1964, Hopf first proposed Hopf algebra in order to study the properties of algebraic topology and algebraic groups [1]. In 1965, Milnor and Moore introduced the basic definitions and properties of Hopf algebras [2], then Chase and Sweedler did some relevant works and introduced common notations [3, 4]. After that, Hopf algebra has been used to study a lot of objects, such as posets [5], symmetric functions [6,7], quantum groups [8], and Clifford algebras [9].

In 1979, Joni and Rota first studied Hopf algebras on combinatorial objects, such as polynomials and puzzles [10]. In 1994 and 1995, Schmitt studied incidence Hopf algebras and a Hopf algebra on graphs with an addition invariant and introduced a variety of examples of incidence Hopf algebras arising from families of graphs, matroids, and distributive lattices, many of which generalize well-known Hopf algebras [11, 12].

In 1997 and 1999, Connes and Kreimer studied Hopf algebra structures on rooted trees and rooted forests and their applications in renormalization in quantum field theories [13, 14]. This promotes the study of Hopf algebras on graphs. In 2020, Aval et al. mentioned a Hopf algebra on labeled graphs arising from the unshuffle coproduct [15].

For more Hopf algebras on graphs, please refer to [16–20].

Permutations are related to graphs closely. In 1995, Malvenuto and Reutenauer studied a Hopf algebra on permutations, where the product is the classic shuffle  $\bowtie$  [21]. In 2014, Vargas defined a commutative but non-cocommutative Hopf algebra on permutations by the super-shuffle product  $\underline{\bowtie}$  and the cut-box coproduct  $\Delta_{\circ}$  without a proof [22], which was done by Liu and Li in 2021 [23]. In 2020, Zhao and Li defined another commutative Hopf algebra structure on permutations and its duality and figured out closed-formulas of the antipodes [24]. It is well-known that permutations are elements of symmetric groups, which are widely used in various fields, such as the algebraic number theory [25].

A labeled simple graph is a simple graph with vertices labeled by distinct positive integers. In this paper, we generalize the super-shuffle product and the cut-box coproduct on permutations to labeled simple graphs. We prove that the vector space spanned by labeled simple graphs with these two operations is a Hopf algebra.

This paper is organized as follows. In Section 2, we review some basic concepts of Hopf algebra, give the definition of labeled simple graphs, and define the super-shuffle product and the cut-box coproduct on labeled simple graphs. In Section 3, we prove that the vector space spanned

by labeled simple graphs is a graded algebra with the super-shuffle product and a graded coalgebra with the cut-box coproduct. Furthermore, we prove the compatibility of these operations, then the vector space is a Hopf algebra. Finally, we summarize our main conclusions in Section 4.

## 2. Basic definitions

### 2.1. Preliminaries

Here, we recall some basic definitions related to Hopf algebra and see [4] for more details. Let  $C$  be a  $\mathbb{K}$ -module over commutative ring  $\mathbb{K}$ .

Define  $\mathbb{K}$ -bilinear mappings  $m$  from  $C \otimes C$  to  $C$  and  $\mu$  from  $\mathbb{K}$  to  $C$ , such that the diagrams in Figure 1 are commutative, then  $(C, m, \mu)$  is a  $\mathbb{K}$ -algebra. Here,  $m$  and  $\mu$  are called a *product* and a *unit*, respectively.

**Figure 1.** Associative law and unitary property.

Define  $\mathbb{K}$ -linear mappings  $\Delta$  from  $C$  to  $C \otimes C$  and  $\nu$  from  $C$  to  $\mathbb{K}$ , such that the diagrams in Figure 2 are commutative, then  $(C, \Delta, \nu)$  is a  $\mathbb{K}$ -coalgebra. Here,  $\Delta$  and  $\nu$  are called a *coproduct* and a *co-unit*, respectively.

We say  $(C, m, \mu, \Delta, \nu)$  is a *bialgebra* if  $(C, m, \mu)$  is an algebra,  $(C, \Delta, \nu)$  is a coalgebra, and one of the following *compatibility* conditions holds:

- (i)  $\Delta$  and co-unit  $\nu$  are algebra homomorphisms;
- (ii)  $m$  and unit  $\mu$  are coalgebra homomorphisms.

In fact, (i) and (ii) are equivalent; see [26] for details.

**Figure 2.** Coassociative law and co-unitary property.

A vector space  $C$  is *graded* if

$$C = \bigoplus_{n \geq 0} C_n$$

and we call it *connected* when  $C_0 \cong \mathbb{K}$  [26]. The algebra  $(C, m, \mu)$  is *graded* if the product  $m$  satisfies

$$m(C_i \otimes C_j) \subseteq C_{i+j}$$

and

$$\mu(\mathbb{K}) \subseteq C_0.$$

Similarly, the coalgebra  $(C, \Delta, \nu)$  is *graded* if the coproduct  $\Delta$  satisfies

$$\Delta(C_n) \subseteq \bigoplus C_i \otimes C_{n-i}$$

and

$$\nu(C_n) = 0,$$

when  $n \geq 1$ . A bialgebra is *graded* when its algebra and coalgebra structures are both graded.

For bialgebra  $(C, m, \mu, \Delta, \nu)$ , we call  $S: C \rightarrow C$  an *antipode* if it satisfies

$$m \circ (S \otimes \text{id}) \circ \Delta = \mu \circ \nu = m \circ (\text{id} \otimes S) \circ \Delta,$$

i.e., the diagram in Figure 3 is commutative. A bialgebra is a *Hopf algebra* when it has an antipode.

Actually, a graded connected bialgebra must be a Hopf algebra [26].

Figure 3. Antipode.

2.2. Main concepts

In this subsection, we recall some basic concepts of graph theory, which can be found in [27].

A labeled simple graph  $\Gamma = (V, E)$  is a finite graph with no cycles and no multiple edges whose vertices are distinct positive integers, where  $V$  is the set of all vertices of  $\Gamma$ , also denoted by  $V(\Gamma)$ , and  $E$  is the set of all edges of  $\Gamma$ , also denoted by  $E(\Gamma)$ . Obviously,  $E \subseteq V \times V$ . If  $(i_1, i_2) \in E$ , then  $i_1 \neq i_2$  and  $(i_2, i_1) \notin E$ , since the graph  $\Gamma$  has no cycles and no multiple edges. In particular,  $\Gamma$  is the empty graph when  $V = \emptyset$ , denoted by  $\epsilon$ .

Let  $\Gamma = (V, E)$  and  $I \subseteq V$ . Define the restriction of  $\Gamma$  on  $I$  by  $\Gamma_I = (I, E_I)$ , where

$$E_I = \{(i, j) | i, j \in I, (i, j) \in E\},$$

and we call  $\Gamma_I$  a subgraph of  $\Gamma$ . If  $I$  is a nontrivial subset of  $V$ , we call  $\Gamma_I$  a true subgraph of  $\Gamma$ . If the vertex sets of two subgraphs of  $\Gamma$  are disjoint, then we say that the subgraphs are disjoint subgraphs. If

$$\Gamma_1 = (V_1, E_1), \quad \Gamma_2 = (V_2, E_2)$$

and

$$V_1 \cap V_2 = \emptyset,$$

then denote

$$\Gamma_1 \cup \Gamma_2 = (V_1 \cup V_2, E_1 \cup E_2).$$

Obviously, there are no edges between  $V_1$  and  $V_2$ .

We introduce the following notations for convenience:

$$[n] = \begin{cases} \{1, 2, \dots, n\}, & n > 0, \\ \emptyset, & n = 0, \end{cases}$$

and

$$[i, j] = \begin{cases} \{i, i + 1, \dots, j\}, & i \leq j, \\ \emptyset, & i > j. \end{cases}$$

Example 1. The labeled simple graph

$$\Gamma = ([8], \{(1, 2), (1, 3), (2, 3), (4, 5), (6, 7), (6, 8)\})$$

can be represented as the graph

then

$$\Gamma_{\{1,3,5,7\}} = (\{1, 3, 5, 7\}, \{(1, 3)\}) = \overset{3}{\bullet}_1 \bullet_5 \bullet_7,$$

$$\Gamma_{[4]} = ([4], \{(1, 2), (1, 3), (2, 3)\}) = \overset{2}{\bullet}_1 \bullet_3 \bullet_4,$$

$$\Gamma_{[3,6]} = ([3, 6], \{(4, 5)\}) = \bullet_3 \overset{5}{\bullet}_4 \bullet_6.$$

Let

$$H_n = \{\Gamma \mid \Gamma = ([n], E) \text{ is a labeled simple graph}\},$$

and  $\mathcal{H}_n$  be the vector space spanned by  $H_n$  over field  $\mathbb{K}$ , for a nonnegative integer  $n$ . In particular,  $H_0 = \{\epsilon\}$  and  $\mathcal{H}_0 = \mathbb{K}H_0$ . Denote

$$H = \bigcup_{n=0}^{\infty} H_n \quad \text{and} \quad \mathcal{H} = \bigoplus_{n=0}^{\infty} \mathcal{H}_n.$$

Let  $\Gamma = (V, E)$  be a nonempty labeled simple graph, where

$$V = \{v_1, v_2, \dots, v_n\}.$$

Define the restructure of  $\Gamma = (V, E)$  by  $\hat{V}$  to be  $\hat{\Gamma} = (\hat{V}, \hat{E})$ , where

$$\hat{V} = \{\hat{v}_1, \hat{v}_2, \dots, \hat{v}_n\}$$

is a set of distinct positive integers satisfying

$$\hat{v}_i < \hat{v}_j \Leftrightarrow v_i < v_j,$$

and  $\hat{E}$  satisfies

$$(\hat{v}_i, \hat{v}_j) \in \hat{E} \Leftrightarrow (v_i, v_j) \in E,$$

for any  $1 \leq i, j \leq n$ .

**Example 2.** For

$$\Gamma = \begin{matrix} 2 & & 7 \\ & \swarrow & \uparrow \\ 5 & & 3 \\ & \searrow & \downarrow \\ & & 8 \end{matrix}$$

the restructure of  $\Gamma$  by [5] is  $\begin{matrix} 1 & & 4 \\ & \swarrow & \uparrow \\ 3 & & 2 \\ & \searrow & \downarrow \\ & & 5 \end{matrix}$  and the restructure of  $\Gamma$  by  $\{1, 3, 5, 7, 9\}$  is  $\begin{matrix} 1 & & 7 \\ & \swarrow & \uparrow \\ 5 & & 3 \\ & \searrow & \downarrow \\ & & 9 \end{matrix}$ .

Let  $I$  be the set  $\{i_1, i_2, \dots, i_n\}$  of distinct positive intergers with  $i_1 < i_2 < \dots < i_n$ . We define a mapping  $st_I$  from  $I$  to  $[[I]]$  to be the *standardization* of  $I$  satisfying  $st_I(i_a) = a$  for  $1 \leq a \leq n$ . For  $x, y \in I$ , we have  $st_I(x) < st_I(y)$  if, and only if,  $x < y$ . For a subset  $S$  of  $I$ , denote

$$st_I(S) = \{st_I(i) | i \in S\}.$$

In general, the standardizations of a number in different sets are different. For example, let  $I_1 = \{6, 7, 9\}$  and  $I_2 = \{1, 3, 7, 9, 11\}$ , then  $st_{I_1}(7) = 2$  and  $st_{I_2}(7) = 3$ . For convenience, we omit the subscript of the set.

Define the *standard form* of  $\Gamma = (V, E)$  by  $st(\Gamma) = (st(V), st(E))$ , where  $st(V) = [[V]]$  and  $st(E)$  satisfies

$$(st(v_1), st(v_2)) \in st(E) \Leftrightarrow (v_1, v_2) \in E.$$

Obviously, the above standardizations are of the vertex set  $V$ , so we omit the subscript. In particular, we have  $st(\epsilon) = \epsilon$ . Thus,  $st(\cdot)$  is a mapping from the set of all labeled simple graphs to  $H$ . In fact, the standard form of  $\Gamma = (V, E)$  is the restructure of  $\Gamma$  by  $[[V]]$ .

In addition, for a positive integer  $n$ , let  $\Gamma^{\uparrow n}$  be the restructure of  $\Gamma$  by the set

$$V^{\uparrow n} := \{v + n | v \in V\}.$$

Similarly, let  $\Gamma^{\downarrow n}$  be the restructure of  $\Gamma$  by the set

$$V^{\downarrow n} := \{v - n | v \in V\}$$

provided  $n$  is less than the minimum of  $V$ .

**Example 3.** For labeled simple graphs

$$\begin{matrix} 5 \\ \uparrow \\ 3 \end{matrix} \bullet_2, \quad \begin{matrix} 5 & & 1 & & 7 \\ & \swarrow & & \searrow & \\ & 2 & & 6 & \end{matrix} \quad \text{and} \quad \bullet_5,$$

their standard forms are

$$st\left(\begin{matrix} 5 \\ \uparrow \\ 3 \end{matrix} \bullet_2\right) = \begin{matrix} 3 \\ \uparrow \\ 2 \end{matrix} \bullet_1, \quad st\left(\begin{matrix} 5 & & 1 & & 7 \\ & \swarrow & & \searrow & \\ & 2 & & 6 & \end{matrix}\right) = \begin{matrix} 3 & & 1 & & 5 \\ & \swarrow & & \searrow & \\ & 2 & & 4 & \end{matrix}$$

$$st(\bullet_5) = \bullet_1,$$

and

$$\left(\begin{matrix} 5 \\ \uparrow \\ 3 \end{matrix} \bullet_2\right)^{\uparrow 3} = \begin{matrix} 8 \\ \uparrow \\ 6 \end{matrix} \bullet_5, \quad \left(\begin{matrix} 5 \\ \uparrow \\ 3 \end{matrix} \bullet_2\right)^{\downarrow 1} = \begin{matrix} 4 \\ \uparrow \\ 2 \end{matrix} \bullet_1.$$

For nonempty  $\Gamma$  in  $H$ , the standard form of any restructure of  $\Gamma$  must be  $\Gamma$ , i.e.,

$$st(\hat{\Gamma}) = (st(\hat{V}), st(\hat{E})) = (V, E) = \Gamma,$$

where the  $\hat{\Gamma}$  is a restructure of  $\Gamma$ . Conversely, if the standard form of a labeled simple graph is  $\Gamma$ , then it must be a restructure of  $\Gamma$ .

**Example 4.** For

$$\Gamma = \begin{matrix} 2 & & 4 \\ & \uparrow & \uparrow \\ 1 & & 3 \\ & \downarrow & \downarrow \\ & & 5 \end{matrix} \in H_5,$$

the restructure of  $\Gamma$  by [4, 8] is  $\begin{matrix} 5 & & 7 \\ & \uparrow & \uparrow \\ 4 & & 6 \\ & \downarrow & \downarrow \\ & & 8 \end{matrix}$  and the restructure of  $\Gamma$  by  $\{1, 3, 5, 7, 9\}$  is  $\begin{matrix} 3 & & 7 \\ & \uparrow & \uparrow \\ 1 & & 5 \\ & \downarrow & \downarrow \\ & & 9 \end{matrix}$ . We have

$$\Gamma = \begin{matrix} 2 & & 4 \\ & \uparrow & \uparrow \\ 1 & & 3 \\ & \downarrow & \downarrow \\ & & 5 \end{matrix} = st\left(\begin{matrix} 5 & & 7 \\ & \uparrow & \uparrow \\ 4 & & 6 \\ & \downarrow & \downarrow \\ & & 8 \end{matrix}\right) = st\left(\begin{matrix} 3 & & 7 \\ & \uparrow & \uparrow \\ 1 & & 5 \\ & \downarrow & \downarrow \\ & & 9 \end{matrix}\right).$$

For  $\Gamma = ([n], E)$  in  $H_n$ , we call  $i$  a *split* of  $\Gamma$  if

$$\Gamma_{[i]} \cup \Gamma_{[i+1, n]} = \Gamma,$$

where  $0 \leq i \leq n$ . Obviously,  $i$  is a split of  $\Gamma$  if, and only if, there are no edges between  $[i]$  and  $[i + 1, n]$  in  $\Gamma$ . By the definition, 0 and  $n$ , called *trivial splits*, are always splits of labeled simple graphs in  $H_n$  when  $n \geq 1$ . We call  $\Gamma$  *indecomposable* if it is nonempty and only has trivial splits.

For  $\Gamma = ([n], E)$  in  $H_n$ ,  $n \geq 1$ , assume that  $\{i_0, i_1, \dots, i_s\}$  is the set of all splits of  $\Gamma$ , where

$$0 = i_0 < i_1 < \dots < i_s = n,$$

then we call  $\Gamma_{[i_{k-1}+1, i_k]}$  an *atom* of  $\Gamma$ ,  $1 \leq k \leq s$ . Obviously, the standard form of an atom is indecomposable since there is no split of  $\Gamma$  in  $[i_{k-1} + 1, i_k]$  for  $1 \leq k \leq s$ . Let

$$\Gamma_k = st(\Gamma_{[i_{k-1}+1, i_k]})$$

for  $1 \leq k \leq s$ . We define the *decomposition* of  $\Gamma$  by

$$\Gamma = \Gamma_1 \diamond \Gamma_2 \diamond \dots \diamond \Gamma_s.$$

Actually, if  $j_k := i_k - i_{k-1}$ , then  $\Gamma_k \in H_{j_k}$  for  $1 \leq k \leq s$ , and

$$\Gamma = \Gamma_1 \diamond \dots \diamond \Gamma_s = \Gamma_1 \cup \Gamma_2^{\uparrow i_1} \cup \dots \cup \Gamma_s^{\uparrow i_{s-1}}.$$

In particular, when  $\Gamma = \epsilon$ , its decomposition is itself.

**Example 5.** (1) The set of splits of  $\downarrow_1^2 \downarrow_3^5 \bullet_4$  is  $\{0, 2, 5\}$  and its decomposition is

$$\downarrow_1^2 \downarrow_3^5 \bullet_4 = \text{st}\left(\downarrow_1^2\right) \diamond \text{st}\left(\downarrow_3^5 \bullet_4\right) = \downarrow_1^2 \diamond \downarrow_1^3 \bullet_2.$$

The atoms of  $\downarrow_1^2 \downarrow_3^5 \bullet_4$  are  $\downarrow_1^2$  and  $\downarrow_3^5 \bullet_4$ .

(2) The set of splits of  $\downarrow_2^1 \downarrow_3^4 \bullet_5$  is  $\{0, 2, 4, 5\}$ , so its decomposition is

$$\downarrow_2^1 \downarrow_3^4 \bullet_5 = \text{st}\left(\downarrow_2^1\right) \diamond \text{st}\left(\downarrow_3^4\right) \diamond \text{st}\left(\bullet_5\right) = \downarrow_2^1 \diamond \downarrow_1^2 \diamond \bullet_1.$$

The atoms of  $\downarrow_2^1 \downarrow_3^4 \bullet_5$  are  $\downarrow_2^1$ ,  $\downarrow_3^4$ , and  $\bullet_5$ .

(3) The set of splits of  $\downarrow_1^2 \blacktriangleright_3$  is  $\{0, 3\}$ , so it is indecomposable. Its decomposition is itself, and so is its atom.

Define the *cut-box coproduct*  $\Delta$  on  $\mathcal{H}$  by

$$\begin{aligned} \Delta(\Gamma) &= \sum_{j=0}^s \Gamma_1 \diamond \cdots \diamond \Gamma_j \otimes \Gamma_{j+1} \diamond \cdots \diamond \Gamma_s \\ &= \sum_{j=0}^s \text{st}(\Gamma_{[1, j]}) \otimes \text{st}(\Gamma_{[j+1, s]}), \end{aligned}$$

for nonempty

$$\Gamma = \Gamma_1 \diamond \Gamma_2 \diamond \cdots \diamond \Gamma_s$$

in  $H_n$  with splits

$$0 = i_0 < i_1 < \cdots < i_s = n \text{ and } \Delta(\epsilon) = \epsilon \otimes \epsilon.$$

Define the *co-unit*  $\nu$  from  $\mathcal{H}$  to  $\mathbb{K}$  by

$$\nu(\Gamma) = \begin{cases} 1, & \Gamma = \epsilon, \\ 0, & \text{otherwise,} \end{cases}$$

for  $\Gamma$  in  $H$ .

**Example 6.**

$$\Delta(\downarrow_1^2 \blacktriangleright_3) = \epsilon \otimes \downarrow_1^2 \blacktriangleright_3 + \downarrow_1^2 \blacktriangleright_3 \otimes \epsilon,$$

$$\Delta(\downarrow_1^2 \downarrow_3^5 \bullet_4) = \Delta(\downarrow_1^2 \diamond \downarrow_1^3 \bullet_2)$$

$$= \epsilon \otimes \downarrow_1^2 \diamond \downarrow_1^3 \bullet_2 + \downarrow_1^2 \otimes \downarrow_1^3 \bullet_2 + \downarrow_1^2 \diamond \downarrow_1^3 \bullet_2 \otimes \epsilon$$

$$= \epsilon \otimes \downarrow_1^2 \downarrow_3^5 \bullet_4 + \downarrow_1^2 \otimes \downarrow_1^3 \bullet_2 + \downarrow_1^2 \downarrow_3^5 \bullet_4 \otimes \epsilon,$$

$$\Delta(\downarrow_2^1 \downarrow_3^4 \bullet_5) = \Delta(\downarrow_2^1 \diamond \downarrow_1^2 \diamond \bullet_1)$$

$$= \epsilon \otimes \downarrow_2^1 \diamond \downarrow_1^2 \diamond \bullet_1 + \downarrow_2^1 \otimes \downarrow_1^2 \diamond \bullet_1$$

$$+ \downarrow_2^1 \diamond \downarrow_1^2 \otimes \bullet_1 + \downarrow_2^1 \otimes \downarrow_1^2 \diamond \bullet_1 \otimes \epsilon$$

$$= \epsilon \otimes \downarrow_2^1 \downarrow_3^4 \bullet_5 + \downarrow_2^1 \otimes \downarrow_1^2 \bullet_3 + \downarrow_2^1 \downarrow_3^4 \otimes \bullet_1 + \downarrow_2^1 \downarrow_3^4 \bullet_5 \otimes \epsilon.$$

**Theorem 2.1.**  $(\mathcal{H}, \Delta, \nu)$  is a graded coalgebra.

*Proof.* It is easy to verify that  $\nu$  is a co-unit. Obviously,

$$(\text{id} \otimes \Delta) \circ \Delta(\epsilon) = \epsilon \otimes \epsilon \otimes \epsilon = (\Delta \otimes \text{id}) \circ \Delta(\epsilon).$$

Suppose  $\Gamma = ([n], E)$  with  $n \geq 1$ , and its decomposition is

$$\Gamma = \Gamma_1 \diamond \Gamma_2 \diamond \cdots \diamond \Gamma_s,$$

then,

$$(\text{id} \otimes \Delta) \circ \Delta(\Gamma)$$

$$= (\text{id} \otimes \Delta) \circ \Delta(\Gamma_1 \diamond \Gamma_2 \diamond \cdots \diamond \Gamma_s)$$

$$= (\text{id} \otimes \Delta) \sum_{j=0}^s \Gamma_1 \diamond \cdots \diamond \Gamma_j \otimes \Gamma_{j+1} \diamond \cdots \diamond \Gamma_s$$

$$= \sum_{j=0}^s \Gamma_1 \diamond \cdots \diamond \Gamma_j \otimes \left( \sum_{k=j}^s \Gamma_{j+1} \diamond \cdots \diamond \Gamma_k \otimes \Gamma_{k+1} \diamond \cdots \diamond \Gamma_s \right)$$

$$= \sum_{0 \leq j \leq k \leq s} \Gamma_1 \diamond \cdots \diamond \Gamma_j \otimes \Gamma_{j+1} \diamond \cdots \diamond \Gamma_k \otimes \Gamma_{k+1} \diamond \cdots \diamond \Gamma_s$$

$$= \sum_{k=0}^s \left( \sum_{j=0}^k \Gamma_1 \diamond \cdots \diamond \Gamma_j \otimes \Gamma_{j+1} \diamond \cdots \diamond \Gamma_k \right) \otimes \Gamma_{k+1} \diamond \cdots \diamond \Gamma_s$$

$$= (\Delta \otimes \text{id}) \sum_{k=0}^s \Gamma_1 \diamond \cdots \diamond \Gamma_k \otimes \Gamma_{k+1} \diamond \cdots \diamond \Gamma_s$$

$$= (\Delta \otimes \text{id}) \circ \Delta(\Gamma),$$

where

$$\Gamma_{k+1} \diamond \cdots \diamond \Gamma_k = \epsilon$$

for  $0 \leq k \leq s$ . So,  $\Delta$  satisfies the coassociative law. Hence,  $(\mathcal{H}, \Delta, \nu)$  is a coalgebra.

By the definition of the coproduct  $\Delta$ , we have

$$\Delta(\mathcal{H}_n) \subseteq \bigoplus \mathcal{H}_i \otimes \mathcal{H}_{n-i}$$

and

$$\nu(\mathcal{H}_n) = 0,$$

when  $n \geq 1$ . So,  $(\mathcal{H}, \Delta, \nu)$  is a graded coalgebra.  $\square$

Define the *super-shuffle product*  $*$  on  $\mathcal{H}$  by

$$\Gamma_1 * \Gamma_2 = \sum_{\substack{I, J: |I|=m, |J|=n \\ I \cup J = [m+n] = V(\Gamma) \\ \text{st}(\Gamma_I) = \Gamma_1, \text{st}(\Gamma_J) = \Gamma_2}} \Gamma \quad (1)$$

for  $\Gamma_1$  in  $H_m$  and  $\Gamma_2$  in  $H_n$ . Sometimes, we denote it by  $*(\Gamma_1, \Gamma_2)$ . Obviously, the product  $*$  is commutative on  $\mathcal{H}$ . Define the *unit*  $\mu$  from  $\mathbb{K}$  to  $\mathcal{H}$  by  $\mu(1) = \epsilon$ .

Actually,  $\Gamma_I$  is the restructure of  $\Gamma_1$  by  $I$ , and  $\Gamma_J$  is the restructure of  $\Gamma_2$  by  $J$  in (1). Given  $I$  and  $J$  satisfying  $|I| = m$ ,  $|J| = n$ , and  $I \cup J = [m+n]$ ,  $\Gamma$  traverses all graphs in  $H_{m+n}$ , which is a union of the restructure of  $\Gamma_1 = (V_1, E_1)$  by  $I$ , the restructure of  $\Gamma_2 = (V_2, E_2)$  by  $J$ , and some edges between  $\hat{V}_1$  and  $\hat{V}_2$ . That is,  $\Gamma$  traverses the set

$$P_{I,J} = \{(\hat{V}_1 \cup \hat{V}_2, \hat{E}_1 \cup \hat{E}_2 \cup C) | \hat{V}_1 = I, \\ \hat{V}_2 = J, C \subseteq \hat{V}_1 \times \hat{V}_2\}.$$

So, we rewrite (1) as

$$\Gamma_1 * \Gamma_2 = \sum_{\substack{I, J: |I|=m, |J|=n \\ I \cup J = [m+n]}} \sum_{\Gamma \in P_{I,J}} \Gamma. \quad (2)$$

That is, each term  $\Gamma$  in  $\Gamma_1 * \Gamma_2$  is a graph by adding some edges between  $\hat{V}_1$  and  $\hat{V}_2$  to  $\hat{\Gamma}_1 \cup \hat{\Gamma}_2$ , where

$$\hat{V}_1 \cup \hat{V}_2 = [m+n],$$

i.e.,

$$\Gamma = (\hat{V}_1 \cup \hat{V}_2, \hat{E}_1 \cup \hat{E}_2 \cup C), \quad (3)$$

where  $C$  is a set of edges between  $\hat{V}_1$  and  $\hat{V}_2$ . Conversely,  $(\hat{V}_1, \hat{V}_2, C)$  can uniquely determine a term in  $\Gamma_1 * \Gamma_2$ , where

$$\hat{V}_1 \cup \hat{V}_2 = [m+n]$$

and  $C$  is a set of edges between  $\hat{V}_1$  and  $\hat{V}_2$ . We consider two terms in  $\Gamma_1 * \Gamma_2$  the same if, and only if, their corresponding  $\hat{V}_1$ ,  $\hat{V}_2$  and  $C$  are the same. Thus, each term in  $\Gamma_1 * \Gamma_2$  is unique.

**Example 7.**

$$\begin{aligned} & \begin{array}{c} \begin{array}{c} \bullet^2 \\ | \\ \bullet^1 \end{array} * \begin{array}{c} \bullet^2 \\ | \\ \bullet^1 \end{array} = \begin{array}{c} \bullet^2 \\ | \\ \bullet^1 \end{array} + \begin{array}{c} \bullet^2 \\ | \\ \bullet^1 \end{array} + \begin{array}{c} \bullet^2 \\ | \\ \bullet^1 \end{array} + \begin{array}{c} \bullet^2 \\ | \\ \bullet^1 \end{array} \\ & + \begin{array}{c} \bullet^3 \\ | \\ \bullet^1 \end{array} + \begin{array}{c} \bullet^3 \\ | \\ \bullet^2 \end{array} + \begin{array}{c} \bullet^3 \\ | \\ \bullet^1 \end{array} + \begin{array}{c} \bullet^3 \\ | \\ \bullet^2 \end{array} + \begin{array}{c} \bullet^3 \\ | \\ \bullet^1 \end{array} + \begin{array}{c} \bullet^3 \\ | \\ \bullet^2 \end{array} \\ & + \begin{array}{c} \bullet^3 \\ | \\ \bullet^2 \end{array} + \begin{array}{c} \bullet^3 \\ | \\ \bullet^1 \end{array} + \begin{array}{c} \bullet^3 \\ | \\ \bullet^2 \end{array} + \begin{array}{c} \bullet^3 \\ | \\ \bullet^1 \end{array}. \end{array}$$

Here, we color the vertices of the term  $\Gamma$  in  $\Gamma_1 * \Gamma_2$  restricted to  $\Gamma_1$  red and to  $\Gamma_2$  blue, respectively. In this example, although  $\begin{array}{c} \bullet^3 \\ | \\ \bullet^2 \end{array} \begin{array}{c} \bullet^1 \\ | \\ \bullet^2 \end{array}$  and  $\begin{array}{c} \bullet^3 \\ | \\ \bullet^1 \end{array} \begin{array}{c} \bullet^2 \\ | \\ \bullet^2 \end{array}$  are the same as graphs, we consider that they are different in  $\Gamma_1 * \Gamma_2$  because their  $\hat{V}_1$  and  $\hat{V}_2$  are not the same. So, each term in  $\Gamma_1 * \Gamma_2$  is unique.

In order to represent vertices in each term of  $\Gamma_1 * \Gamma_2$  before restructure, we name the vertices in  $\Gamma_1$  and  $\Gamma_2$ , respectively, as

$$V(\Gamma_1) = \{v_{11}, v_{12}, \dots, v_{1m}\}$$

and

$$V(\Gamma_2) = \{v_{21}, v_{22}, \dots, v_{2n}\},$$

where  $v_{11} < v_{12} < \dots < v_{1m}$  and  $v_{21} < v_{22} < \dots < v_{2n}$ . Although  $v_{11}$  and  $v_{21}$  are both equal to 1, we consider that they are different because they belong to different graphs, then the vertex set of a term in  $\Gamma_1 * \Gamma_2$  is

$$\hat{V}_1 \cup \hat{V}_2 = \{\hat{v}_{11}, \dots, \hat{v}_{1m}, \hat{v}_{21}, \dots, \hat{v}_{2n}\} = [m+n].$$

**Theorem 2.2.**  $(\mathcal{H}, *, \mu)$  is a graded algebra.

*Proof.* It is easy to verify that  $\mu$  is a unit. Suppose

$$\Gamma_1 = ([n_1], E_1), \quad \Gamma_2 = ([n_2], E_2)$$

and

$$\Gamma_3 = ([n_3], E_3)$$

in  $H$ . For any term  $\Gamma$  in  $(\Gamma_1 * \Gamma_2) * \Gamma_3$ , it corresponds to two disjoint subsets  $J$  and  $K$  of  $[n_1+n_2+n_3]$  with  $|J| = n_1+n_2$  and  $|K| = n_3$ , such that  $\text{st}(\Gamma_J)$  is a term in  $\Gamma_1 * \Gamma_2$  and  $\text{st}(\Gamma_K) = \Gamma_3$ . It means

$$(\Gamma_1 * \Gamma_2) * \Gamma_3 = \sum_{\substack{J, K: |J|=n_1+n_2, |K|=n_3 \\ J \cup K = [n_1+n_2+n_3] = V(\Gamma) \\ \text{st}(\Gamma_J) \text{ is a term in } \Gamma_1 * \Gamma_2}} \sum_{\text{st}(\Gamma_K) = \Gamma_3} \Gamma. \quad (4)$$

For a fixed  $J$  in (4),  $\text{st}(\Gamma_J)$  corresponds to two disjoint subsets  $P$  and  $Q$  of  $[n_1+n_2]$  with  $|P| = n_1$  and  $|Q| = n_2$ , such that

$$\text{st}(\text{st}(\Gamma_J)_P) = \Gamma_1$$

and

$$\text{st}(\text{st}(\Gamma_J)_Q) = \Gamma_2.$$

Therefore, there is a subset  $M$  of  $J$  with  $|M| = n_1$  corresponding to  $P$ , i.e.,  $\text{st}_J(M) = P$ , such that

$$\text{st}(\Gamma_M) = \text{st}(\text{st}(\Gamma_J)_P) = \Gamma_1.$$

Similarly, there is a subset  $N$  of  $J$  with  $|N| = n_2$  corresponding to  $Q$ , i.e.,  $\text{st}_J(N) = Q$ , such that

$$\text{st}(\Gamma_N) = \text{st}(\text{st}(\Gamma_J)_Q) = \Gamma_2.$$

That means (4) can be rewritten as

$$(\Gamma_1 * \Gamma_2) * \Gamma_3 = \sum_{\substack{J, K: |J|=n_1+n_2, |K|=n_3 \\ J \cup K = [n_1+n_2+n_3] = V(\Gamma)}} \sum_{\substack{M, N: |M|=n_1, |N|=n_2 \\ M \cup N = J \\ \text{st}(\Gamma_M) = \Gamma_1, \text{st}(\Gamma_N) = \Gamma_2, \text{st}(\Gamma_K) = \Gamma_3}} \Gamma. \quad (5)$$

For a fixed subset  $J$  in  $[n_1 + n_2 + n_3]$  with cardinality  $n_1 + n_2$ ,  $P$  traverses all subsets with cardinality  $n_1$  in  $[n_1 + n_2]$  since  $\text{st}(\Gamma_J)$  traverses all terms in  $\Gamma_1 * \Gamma_2$ . Meanwhile,  $M$  traverses all subsets with cardinality  $n_1$  in  $J$ . Therefore,  $M$  traverses all subsets with cardinality  $n_1$  in  $[n_1 + n_2 + n_3]$  since  $J$  traverses all subsets with cardinality  $n_1 + n_2$  in  $[n_1 + n_2 + n_3]$ . At the same time,  $N$  traverses all subsets with cardinality  $n_2$  in  $[n_1 + n_2 + n_3]$  from  $J = M \cup N$ . Thus, (5) can be rewritten as

$$(\Gamma_1 * \Gamma_2) * \Gamma_3 = \sum_{\substack{M, N, K: |M|=n_1, |N|=n_2, |K|=n_3 \\ M \cup N \cup K = [n_1+n_2+n_3] = V(\Gamma) \\ \text{st}(\Gamma_M) = \Gamma_1, \text{st}(\Gamma_N) = \Gamma_2, \text{st}(\Gamma_K) = \Gamma_3}} \Gamma. \quad (6)$$

Similarly,  $\Gamma_1 * (\Gamma_2 * \Gamma_3)$  is equal to (6). Hence,  $*$  satisfies the associative law and  $(\mathcal{H}, *, \mu)$  is an algebra.

By the definition of the product  $*$ , we have

$$\mathcal{H}_i * \mathcal{H}_j \subseteq \mathcal{H}_{i+j}$$

and

$$\mu(\mathbb{K}) \subseteq \mathcal{H}_0.$$

So,  $(\mathcal{H}, *, \mu)$  is a graded algebra.  $\square$

### 3. Main theorems

In this section, we will prove that  $(\mathcal{H}, *, \mu, \Delta, \nu)$  is a Hopf algebra. Now, we give two lemmas.

Let  $\Gamma_1 = (V_1, E_1)$  in  $H_m$  and  $\Gamma_2 = (V_2, E_2)$  in  $H_n$  be nonempty graphs and  $\Gamma$  be a term in  $\Gamma_1 * \Gamma_2$ . Thus,  $\Gamma$  can be represented by  $(\hat{V}_1 \cup \hat{V}_2, \hat{E}_1 \cup \hat{E}_2 \cup C)$  from (3), where

$$\hat{\Gamma}_1 := (\hat{V}_1, \hat{E}_1)$$

is the restructure of  $\Gamma_1$  by  $\hat{V}_1$  and

$$\hat{\Gamma}_2 := (\hat{V}_2, \hat{E}_2)$$

is the restructure of  $\Gamma_2$  by  $\hat{V}_2$ . Obviously,

$$\hat{V}_1 \cup \hat{V}_2 = [m + n].$$

**Lemma 3.1.** *Each atom of  $\Gamma$  in  $\Gamma_1 * \Gamma_2$  can only contain subgraphs of  $\hat{\Gamma}_1$  or  $\hat{\Gamma}_2$  corresponding to some complete atoms in  $\Gamma_1$  or  $\Gamma_2$ .*

*Proof.* Let

$$\Gamma_1 = (\{v_{11}, \dots, v_{1m}\}, E_1)$$

and

$$\Gamma_2 = (\{v_{21}, \dots, v_{2n}\}, E_2)$$

be nonempty in  $H$ , where  $v_{11} < \dots < v_{1m}$  and  $v_{21} < \dots < v_{2n}$ . Consider a term  $\Gamma$  in  $\Gamma_1 * \Gamma_2$ . Suppose  $\Gamma_{[i,j]}$  is an atom of  $\Gamma$  containing a nonempty subgraph of  $\hat{\Gamma}_{1\{\hat{v}_{1k}\}_{k=p}^q}$ , where  $\hat{\Gamma}_{1\{\hat{v}_{1k}\}_{k=p}^q}$  corresponds to the atom  $\Gamma_{1\{v_{1k}\}_{k=p}^q}$  of  $\Gamma_1$ .

When  $p = q$ , there is only one element in  $\{\hat{v}_{1k}\}_{k=p}^q$ , then  $\Gamma_{[i,j]}$  contains the complete atom  $\hat{\Gamma}_{1\{\hat{v}_{1k}\}_{k=p}^q}$ . Hence, the conclusion holds.

When  $1 \leq p < q \leq m$ ,  $\{v_{1k}\}_{k=p}^q$  contains at least two vertices. Suppose that  $\Gamma_{[i,j]}$  contains a true subgraph of  $\hat{\Gamma}_{1\{\hat{v}_{1k}\}_{k=p}^q}$ . In fact, since  $\{\hat{v}_{1k}\}_{k=p}^q$  maintains the order relationship in  $\{v_{1k}\}_{k=p}^q$ , the vertices of this true subgraph correspond to a true subinterval in  $\{v_{1k}\}_{k=p}^q$ . Let

$$\omega = \min\{k \mid \hat{v}_{1k} \in [i, j], p \leq k \leq q\}$$

and

$$\Omega = \max\{k \mid \hat{v}_{1k} \in [i, j], p \leq k \leq q\}.$$

We have  $i \leq \hat{v}_{1\omega} \leq \hat{v}_{1\Omega} \leq j$ , then

$$\{\hat{v}_{1k}\}_{k=\omega}^{\Omega} \subseteq [i, j]$$

and  $\omega \neq p$  or  $\Omega \neq q$  because  $\Gamma_{[i,j]}$  contains a true subgraph of  $\hat{\Gamma}_{1\{\hat{v}_{1k}\}_{k=p}^q}$ .

If  $\omega \neq p$ , then  $\omega > p$ . From

$$1 \leq \max_{1 \leq k \leq \omega-1} \{\hat{v}_{1k}\} < i \leq \min_{\omega \leq k \leq m} \{\hat{v}_{1k}\},$$

$$\{\hat{v}_{1k}\}_{k=1}^{\omega-1} \subseteq [i-1]$$

and

$$\{\hat{v}_{1k}\}_{k=\omega}^m \subseteq [i, m+n].$$

From  $\Gamma_{[i,j]}$  is an atom of  $\Gamma$  and  $i-1$  is a split of  $\Gamma$ , there are no edges between  $[i-1]$  and  $[i, m+n]$  in  $\Gamma$ . Therefore,

$$\Gamma_{\{\hat{v}_{1k}\}_{k=1}^m} = \Gamma_{\{\hat{v}_{1k}\}_{k=1}^{\omega-1}} \cup \Gamma_{\{\hat{v}_{1k}\}_{k=\omega}^m}.$$

By the definition of  $*$ , we have

$$\text{st}(\Gamma_{\{\hat{v}_{1k}\}_{k=1}^m}) = \Gamma_1$$

and

$$\text{st}_{\hat{v}_1}(\hat{v}_{1k}) = v_{1k} = k.$$

Hence,

$$\begin{aligned} \Gamma_1 &= \text{st}(\Gamma_{\{\hat{v}_{1k}\}_{k=1}^m}) \\ &= \text{st}(\Gamma_{\{\hat{v}_{1k}\}_{k=1}^{\omega-1}} \cup \Gamma_{\{\hat{v}_{1k}\}_{k=\omega}^m}) \\ &= \Gamma_{1[\omega-1]} \cup \Gamma_{1[\omega,m]}, \end{aligned}$$

where  $p-1 < \omega-1 < q$ , i.e.,  $\omega-1$  is a split of  $\Gamma_1$ . However, there is no split of  $\Gamma_1$  between  $p-1$  and  $q$ , since  $\Gamma_{1\{v_{1k}\}_{k=p}^q}$  is an atom of  $\Gamma_1$ , which is a contradiction. Similarly, when  $\Omega \neq q$ , we have  $p-1 < \Omega < q$  and  $\Omega$  is a split of  $\Gamma_1$ , a contradiction.

Thus, if an atom of  $\Gamma$  contains a true subgraph in  $\hat{\Gamma}_1$ , then this subgraph must correspond to some complete atoms of  $\Gamma_1$ . Similarly, we can prove the conclusion holds for atoms in  $\Gamma_2$ .  $\square$

For simplicity, we restate Lemma 3.1 as: for any term  $\Gamma$  in  $\Gamma_1 * \Gamma_2$ , any atom of  $\Gamma$  can only contain some complete original atoms of  $\Gamma_1$  or  $\Gamma_2$ .

**Remark 3.1.** For  $\Gamma$  in  $H_n$ , suppose its decomposition is

$$\Gamma = \Gamma_1 \diamond \Gamma_2 \diamond \cdots \diamond \Gamma_s$$

with splits

$$0 = i_0 < i_1 < \cdots < i_s = n,$$

then

$$\begin{aligned} \Delta(\Gamma) &= \sum_{k=0}^s \Gamma_1 \diamond \cdots \diamond \Gamma_k \otimes \Gamma_{k+1} \diamond \cdots \diamond \Gamma_s \\ &= \sum_{k=0}^s \text{st}(\Gamma_{[1,i_k]}) \otimes \text{st}(\Gamma_{[i_k+1,i_s]}). \end{aligned}$$

If  $\Theta_1 \otimes \Theta_2$  is the term in  $\Delta(\Gamma)$ , then  $\Theta_1$  is a standard form of the first  $k$  atoms of  $\Gamma$  for some  $0 \leq k \leq s$ . Let  $\Gamma$  be a term in  $\Gamma_1 * \Gamma_2$  and  $\Theta_1 \otimes \Theta_2$  be a term in  $\Delta(\Gamma)$ . From Lemma 3.1,  $\Theta_1$  only contains the standard forms of some complete original atoms of  $\Gamma_1$  or  $\Gamma_2$ . If the first few atoms of a labeled simple graph contain  $l$  vertices, then these vertices must be  $[l]$ . So, if  $\Theta_1$  contains  $i$  original atoms of  $\Gamma_1$ , then they must be the

first  $i$  atoms of  $\Gamma_1$ . Similarly, if  $\Theta_1$  contains  $j$  original atoms of  $\Gamma_2$ , then they must be the first  $j$  atoms of  $\Gamma_2$ .

Let  $\Gamma_1$  and  $\Gamma_2$  be nonempty in  $H$ . Suppose their decompositions are

$$\Gamma_1 = \Gamma_{11} \diamond \cdots \diamond \Gamma_{1s}$$

and

$$\Gamma_2 = \Gamma_{21} \diamond \cdots \diamond \Gamma_{2t}.$$

Define  $\Delta_{ij}(\Gamma_1 * \Gamma_2)$  to be the sum of all terms  $\Theta_1 \otimes \Theta_2$  in  $\Delta(\Gamma_1 * \Gamma_2)$ , where  $\Theta_1$  contains the first  $i$  complete original atoms in  $\Gamma_1$  and the first  $j$  complete original atoms in  $\Gamma_2$ ,  $0 \leq i \leq s$ , and  $0 \leq j \leq t$ .

**Lemma 3.2.** Let  $\Gamma_1$  and  $\Gamma_2$  be nonempty in  $H$ . Assume their decompositions are

$$\Gamma_1 = \Gamma_{11} \diamond \cdots \diamond \Gamma_{1s} \text{ and } \Gamma_2 = \Gamma_{21} \diamond \cdots \diamond \Gamma_{2t},$$

then,

$$\begin{aligned} \Delta_{ij}(\Gamma_1 * \Gamma_2) &= (\Gamma_{11} \diamond \cdots \diamond \Gamma_{1i} * \Gamma_{21} \diamond \cdots \diamond \Gamma_{2j}) \\ &\quad \otimes (\Gamma_{1,i+1} \diamond \cdots \diamond \Gamma_{1s} * \Gamma_{2,j+1} \diamond \cdots \diamond \Gamma_{2t}), \end{aligned}$$

for  $0 \leq i \leq s$  and  $0 \leq j \leq t$ .

*Proof.* Denote

$$V(\Gamma_{11} \diamond \cdots \diamond \Gamma_{1i}) = V_{11},$$

$$|V_{11}| = h_1, \quad V_1 \setminus V_{11} = V_{12},$$

and

$$(E_1)_{V_{11}} = E_{11}, \quad (E_1)_{V_{12}} = E_{12}.$$

Similarly,

$$V(\Gamma_{21} \diamond \cdots \diamond \Gamma_{2j}) = V_{21}, \quad |V_{21}| = h_2, \quad V_2 \setminus V_{21} = V_{22},$$

and

$$(E_2)_{V_{21}} = E_{21}, \quad (E_2)_{V_{22}} = E_{22}.$$

Obviously,

$$\Gamma_1 = (V_{11} \cup V_{12}, E_{11} \cup E_{12})$$

and

$$\Gamma_2 = (V_{21} \cup V_{22}, E_{21} \cup E_{22}).$$

Next, we denote  $\hat{V}_{11}$  as the subset corresponding to  $V_{11}$  in  $\hat{V}_1$  and  $(\hat{V}_{11}, \hat{E}_{11})$  as the restructure  $(V_{11}, E_{11})$  by  $\hat{V}_{11}$ . Similarly, we have  $\hat{V}_{12}, \hat{E}_{12}, \hat{V}_{21}, \hat{E}_{21}, \hat{V}_{22}$ , and  $\hat{E}_{22}$ .

By (3), each term  $\Gamma$  in  $\Gamma_1 * \Gamma_2$ ,

$$\Gamma = (\hat{V}_1 \cup \hat{V}_2, \hat{E}_1 \cup \hat{E}_2 \cup C),$$

where  $C$  is a set of edges between  $\hat{V}_1$  and  $\hat{V}_2$ . Let  $\Theta_1 \otimes \Theta_2$  be a term in  $\Delta(\Gamma)$  and in  $\Delta_{ij}(\Gamma_1 * \Gamma_2)$ . By the definition of  $\Delta_{ij}$ ,  $h_1 + h_2$  is a split of  $\Gamma$ ,

$$\hat{V}_{11} \cup \hat{V}_{21} = [h_1 + h_2],$$

$$\hat{V}_{12} \cup \hat{V}_{22} = [h_1 + h_2 + 1, m + n]$$

and

$$\Theta_1 = \text{st}(\Gamma_{[h_1+h_2]}) = \text{st}(\Gamma_{\hat{V}_{11} \cup \hat{V}_{21}}).$$

Since  $h_1 + h_2$  is a split of  $\Gamma$ , there are no edges between  $[h_1 + h_2]$  and  $[h_1 + h_2 + 1, m + n]$  in  $\Gamma$ . Thus, there are no edges between  $\hat{V}_{11}$  and  $\hat{V}_{22}$  and no edges between  $\hat{V}_{12}$  and  $\hat{V}_{21}$ . Therefore,  $C$  is  $C_1 \cup C_2$ , where

$$C_1 \subseteq \hat{V}_{11} \times \hat{V}_{21}$$

and

$$C_2 \subseteq \hat{V}_{12} \times \hat{V}_{22}.$$

Hence,

$$\Gamma = (\hat{V}_{11} \cup \hat{V}_{12} \cup \hat{V}_{21} \cup \hat{V}_{22}, \hat{E}_{11} \cup \hat{E}_{12} \cup \hat{E}_{21} \cup \hat{E}_{22} \cup C_1 \cup C_2). \quad (7)$$

Therefore,

$$\Theta_1 = \text{st}[(\hat{V}_{11} \cup \hat{V}_{21}, \hat{E}_{11} \cup \hat{E}_{21} \cup C_1)]$$

and

$$\Theta_2 = \text{st}[(\hat{V}_{12} \cup \hat{V}_{22}, \hat{E}_{12} \cup \hat{E}_{22} \cup C_2)],$$

then  $\Theta_1$  is a term in

$$\Gamma_{11} \diamond \cdots \diamond \Gamma_{1i} * \Gamma_{21} \diamond \cdots \diamond \Gamma_{2j}$$

for

$$\text{st}((\Theta_1)_{\hat{V}_{11}}) = \text{st}(\hat{V}_{11}, \hat{E}_{11}) = \Gamma_{11} \diamond \cdots \diamond \Gamma_{1i}$$

and

$$\text{st}((\Theta_1)_{\hat{V}_{21}}) = \text{st}(\hat{V}_{21}, \hat{E}_{21}) = \Gamma_{21} \diamond \cdots \diamond \Gamma_{2j}.$$

Similarly,  $\Theta_2$  is a term in

$$\Gamma_{1,i+1} \diamond \cdots \diamond \Gamma_{1s} * \Gamma_{2,j+1} \diamond \cdots \diamond \Gamma_{2t}.$$

For given  $\Theta_1$  in  $\Gamma_{11} \diamond \cdots \diamond \Gamma_{1i} * \Gamma_{21} \diamond \cdots \diamond \Gamma_{2j}$ , let

$$S = \left\{ \Gamma \left| \begin{array}{l} \Gamma \text{ is a term in } \Gamma_1 * \Gamma_2 \text{ and } \exists \Theta_2 \text{ s.t. } \Theta_1 \otimes \Theta_2 \\ \text{is a term in } \Delta(\Gamma) \text{ and in } \Delta_{ij}(\Gamma_1 * \Gamma_2) \end{array} \right. \right\}.$$

For each  $\Gamma$  in  $S$ ,

$$\Gamma = (\hat{V}_{11} \cup \hat{V}_{12} \cup \hat{V}_{21} \cup \hat{V}_{22}, \hat{E}_{11} \cup \hat{E}_{12} \cup \hat{E}_{21} \cup \hat{E}_{22} \cup C_1 \cup C_2)$$

by (7), where  $\hat{V}_{11}, \hat{V}_{21}$ , and  $C_1$  are fixed, since  $\Theta_1$  is fixed.

By (3), when  $\Gamma$  traverses all terms in  $\Gamma_1 * \Gamma_2$ , its  $\hat{V}_1$  and  $\hat{V}_2$  traverse all disjoint subsets of  $[m+n]$  with cardinalities  $m$  and  $n$ , respectively, and  $C$  traverses all subsets in  $\hat{V}_1 \times \hat{V}_2$  for fixed  $\hat{V}_1$  and  $\hat{V}_2$ . Thus,  $\hat{V}_{12}$  and  $\hat{V}_{22}$  of  $\Gamma$  in  $S$  traverse all disjoint subsets of  $[h_1 + h_2 + 1, m + n]$  with cardinalities  $m - h_1$  and  $n - h_2$ , respectively. Also,  $C_2$  of  $\Gamma$  in  $S$  traverses all subsets of  $\hat{V}_{12} \times \hat{V}_{22}$  for fixed  $\hat{V}_{12}$  and  $\hat{V}_{22}$ . Correspondingly, for  $\hat{V}_{12}$  and  $\hat{V}_{22}$  of  $\Gamma$  in  $S$ ,  $\text{st}_{\hat{V}_{12} \cup \hat{V}_{22}}(\hat{V}_{12})$  and  $\text{st}_{\hat{V}_{12} \cup \hat{V}_{22}}(\hat{V}_{22})$  traverse all disjoint subsets of  $[m + n - h_1 - h_2]$  with cardinalities  $m - h_1$  and  $n - h_2$ , respectively. Also,  $\text{st}_{\hat{V}_{12} \cup \hat{V}_{22}}(C_2)$  traverses all subsets in

$$\text{st}_{\hat{V}_{12} \cup \hat{V}_{22}}(\hat{V}_{12}) \times \text{st}_{\hat{V}_{12} \cup \hat{V}_{22}}(\hat{V}_{22})$$

for fixed  $\hat{V}_{12}$  and  $\hat{V}_{22}$ . From the arguments above and (2), for fixed  $\Theta_1$  in  $\Gamma_{11} \diamond \cdots \diamond \Gamma_{1i} * \Gamma_{21} \diamond \cdots \diamond \Gamma_{2j}$ ,  $\Theta_2$  traverses all terms in  $\Gamma_{1,i+1} \diamond \cdots \diamond \Gamma_{1s} * \Gamma_{2,j+1} \diamond \cdots \diamond \Gamma_{2t}$ . Similarly, for fixed  $\Theta_2$  in  $\Gamma_{1,i+1} \diamond \cdots \diamond \Gamma_{1s} * \Gamma_{2,j+1} \diamond \cdots \diamond \Gamma_{2t}$ ,  $\Theta_1$  traverses all terms in  $\Gamma_{11} \diamond \cdots \diamond \Gamma_{1i} * \Gamma_{21} \diamond \cdots \diamond \Gamma_{2j}$ . Therefore,

$$\begin{aligned} \Delta_{ij}(\Gamma_1 * \Gamma_2) &= (\Gamma_{11} \diamond \cdots \diamond \Gamma_{1i} * \Gamma_{21} \diamond \cdots \diamond \Gamma_{2j}) \\ &\quad \otimes (\Gamma_{1,i+1} \diamond \cdots \diamond \Gamma_{1s} * \Gamma_{2,j+1} \diamond \cdots \diamond \Gamma_{2t}). \end{aligned}$$

□

Next, we show that  $(\mathcal{H}, *, \mu, \Delta, \nu)$  is a Hopf algebra.

**Theorem 3.1.**  $(\mathcal{H}, *, \mu, \Delta, \nu)$  is a bialgebra.

*Proof.* It is easy to verify  $\nu$  is an algebra homomorphism. We only need to prove  $\Delta$  is an algebra homomorphism, i.e.,

$$\Delta(\Gamma_1 * \Gamma_2) = \Delta(\Gamma_1) * \Delta(\Gamma_2) \quad (8)$$

for  $\Gamma_1$  and  $\Gamma_2$  in  $H$ .

If  $\Gamma_1$  or  $\Gamma_2$  is an empty graph, then (8) holds. Suppose

$$\Gamma_1 = (V_1, E_1) = \Gamma_{11} \diamond \cdots \diamond \Gamma_{1s}$$

in  $H_m$  and

$$\Gamma_2 = (V_2, E_2) = \Gamma_{21} \diamond \cdots \diamond \Gamma_{2t}$$

in  $H_n$  are nonempty graphs. Let

$$\Delta_i(\Gamma_1 * \Gamma_2) = \sum_{j=0}^t \Delta_{ij}(\Gamma_1 * \Gamma_2).$$

By Lemma 3.2, we have

$$\begin{aligned} \Delta_i(\Gamma_1 * \Gamma_2) &= \Gamma_{11} \diamond \cdots \diamond \Gamma_{1i} \otimes (\Gamma_{1,i+1} \diamond \cdots \diamond \Gamma_{1s} * \Gamma_{21} \diamond \cdots \diamond \Gamma_{2t}) \\ &\quad + (\Gamma_{11} \diamond \cdots \diamond \Gamma_{1i} * \Gamma_{21}) \\ &\quad \otimes (\Gamma_{1,i+1} \diamond \cdots \diamond \Gamma_{1s} * \Gamma_{22} \diamond \cdots \diamond \Gamma_{2t}) \\ &\quad + (\Gamma_{11} \diamond \cdots \diamond \Gamma_{1i} * \Gamma_{21} \diamond \Gamma_{22}) \\ &\quad \otimes (\Gamma_{1,i+1} \diamond \cdots \diamond \Gamma_{1s} * \Gamma_{23} \diamond \cdots \diamond \Gamma_{2t}) \\ &\quad + \cdots \\ &\quad + (\Gamma_{11} \diamond \cdots \diamond \Gamma_{1i} * \Gamma_{21} \diamond \cdots \diamond \Gamma_{2t}) \otimes \Gamma_{1,i+1} \diamond \cdots \diamond \Gamma_{1s} \\ &= \sum_{j=0}^t (\Gamma_{11} \diamond \cdots \diamond \Gamma_{1i} * \Gamma_{21} \diamond \cdots \diamond \Gamma_{2j}) \\ &\quad \otimes (\Gamma_{1,i+1} \diamond \cdots \diamond \Gamma_{1s} * \Gamma_{2,j+1} \diamond \cdots \diamond \Gamma_{2t}) \\ &= (\Gamma_{11} \diamond \cdots \diamond \Gamma_{1i} \otimes \Gamma_{1,i+1} \diamond \cdots \diamond \Gamma_{1s}) \\ &\quad * \left( \sum_{j=0}^t \Gamma_{21} \diamond \cdots \diamond \Gamma_{2j} \otimes \Gamma_{2,j+1} \diamond \cdots \diamond \Gamma_{2t} \right) \\ &= (\Gamma_{11} \diamond \cdots \diamond \Gamma_{1i} \otimes \Gamma_{1,i+1} \diamond \cdots \diamond \Gamma_{1s}) * \Delta(\Gamma_2). \end{aligned}$$

Furthermore,

$$\begin{aligned} \Delta(\Gamma_1 * \Gamma_2) &= \Delta_0(\Gamma_1 * \Gamma_2) + \Delta_1(\Gamma_1 * \Gamma_2) + \cdots + \Delta_s(\Gamma_1 * \Gamma_2) \\ &= \left( \sum_{i=0}^s \Gamma_{11} \diamond \cdots \diamond \Gamma_{1i} \otimes \Gamma_{1,i+1} \diamond \cdots \diamond \Gamma_{1s} \right) * \Delta(\Gamma_2) \\ &= \Delta(\Gamma_1) * \Delta(\Gamma_2). \end{aligned}$$

Hence,  $(\mathcal{H}, *, \mu, \Delta, \nu)$  is a bialgebra.  $\square$

**Example 8.**

$$\begin{aligned} \Delta\left(\begin{array}{c} \bullet \\ \bullet \\ \bullet \end{array} * \bullet\right) &= \Delta\left(\begin{array}{c} \bullet \\ \bullet \\ \bullet \end{array} \bullet_3 + \bullet \\ \bullet \end{array} \bullet_1 \right) * (\bullet \otimes \epsilon) \left( \epsilon \otimes \begin{array}{c} \bullet \\ \bullet \\ \bullet \end{array} \bullet_1 + \begin{array}{c} \bullet \\ \bullet \\ \bullet \end{array} \bullet_1 \otimes \epsilon \right) * (\epsilon \otimes \bullet + \bullet \otimes \epsilon) \\ &= \Delta\left(\begin{array}{c} \bullet \\ \bullet \\ \bullet \end{array} \bullet_1\right) * \Delta(\bullet). \end{aligned}$$

**Corollary 3.1.**  $(\mathcal{H}, *, \mu, \Delta, \nu)$  is a Hopf algebra.

*Proof.* Since  $(\mathcal{H}, *, \mu, \Delta, \nu)$  is a graded connected bialgebra, it is a Hopf algebra.  $\square$

## 4. Conclusions

Many combinatorial objects have Hopf algebra structures. The labeled simple graphs are important combinatorial objects. In this paper, we generalize the super-shuffle product and the cut-box coproduct on permutations to labeled simple graphs. We prove that the vector space spanned by labeled simple graphs with the super-shuffle product and the cut-box coproduct is a Hopf algebra. In the future, we will study the duality of the Hopf algebra  $(\mathcal{H}, *, \mu, \Delta, \nu)$ .  $\square$
